Tushar Jankhyan

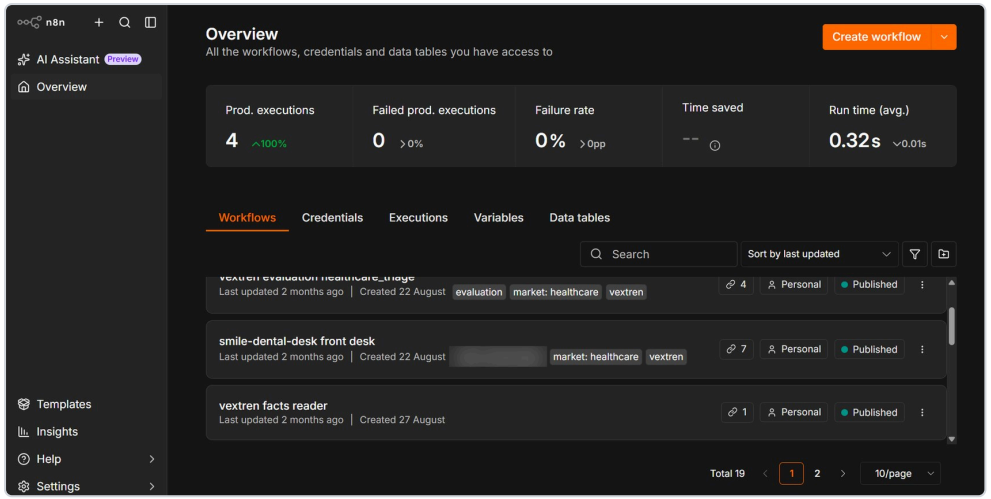

n8n Automation | WhatsApp Business API, webhooks, AI agents

- **WhatsApp gateway** — Inbound messages routed to the right flow, AI replies, human handover, retries and duplicate protection.
- **Lead handling** — Instant replies to new leads, booking via Cal.com, follow-up nudges, and a log of every conversation.
- **Industry demos** — 19 workflows built for clinics, legal intake, freight quotes, real estate and online stores.
- **Secure by default** — Every webhook is protected with its own secret, and credentials are kept separate per workflow.
- **Also** — Cloudflare Workers backends and ad tracking, so leads from ads land straight in an n8n workflow.

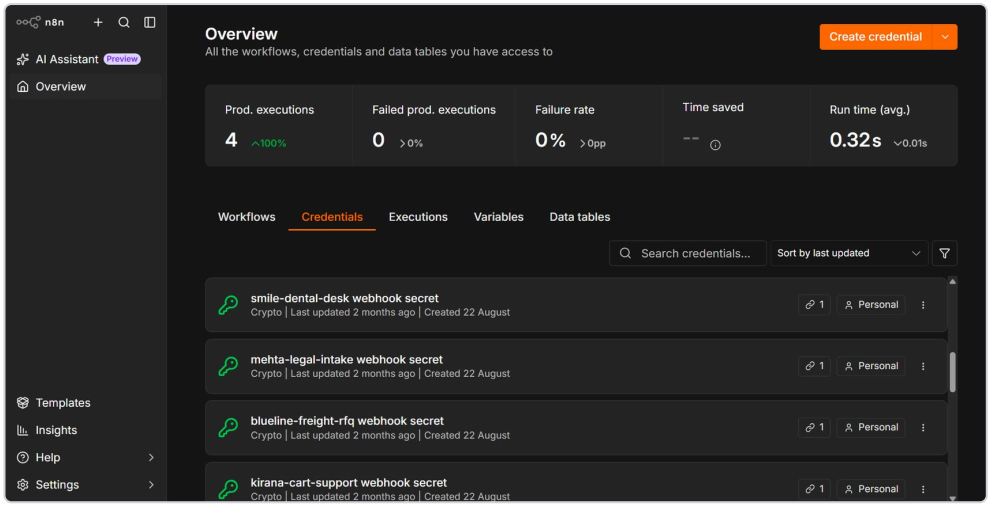

Every screenshot in this document is from my own n8n instance.

WhatsApp gateway. Routing, AI reply, human handover and retries in one workflow.

19 demo automation workflows. Healthcare, legal, freight and retail.

Security. Each workflow is secured with its own webhook secret.

What I bring to a team

How I work, as shown by the workflows in this document.

- **Built for failure** — Retries, duplicate protection and human handover are part of the WhatsApp gateway, not added later.
- **Secure by default** — Each webhook has its own secret; credentials are kept separate per workflow.
- **Clear handover** — Short written notes for every change: what was broken, what I changed and how to check it.
- **Tracking background** — Server-side GTM, GA4 and Meta CAPI work is documented in a separate PDF.
